Unsupervised learning

- Supervised learning: $Trainingdata = \{(\mathbf{x}_i, y_i)\}_{i=1}^n$
- Unsupervised learning: $Trainingdata = \{\mathbf{x}_i\}_{i=1}^n$
- Can be used on its own, but also as a pre-processing step before supervised learning!

Principal component analysis (PCA)

- $\mathbf{x}_i = [x_{i1}, x_{i2}, ..., x_{ip}]^T$
- Can we find $\mathbf{x}_i = [z_{i1}, z_{i2}, ..., z_{ik}]^T$, k << p such that $\mathbf{x}_i \approx \mathbf{z}_i$ (in some sense)?
- Find a k-dimensional subspace in which the data approximately lies.
- I.e., the subspace captures almost all variation in the data.

Omid Safarzadeh Introduction to Statistical learning February 2, 2022 4/

Centralize and standardize

- $\bar{x}_j = \frac{1}{n} \sum_{i=1}^n x_{ij}, j = 1, ..., p$
- $\sigma_j^2 = \frac{1}{n} \sum_{i=1}^n x_{ij}^2, j = 1, ..., p$
- $x_{ij} \leftarrow \frac{x_{ij} \bar{x}_j}{\sigma_j}, j = 1, ..., p, i = 1, ..., n.$
- ullet Dividing by σ_j is not necessary if attributes are on the same scale. Ex: Each correspond to value in USD

Computing the major axis of variation

- Major axis of variation = first principal component
- Projection of $\mathbf{x} = [x_1, ..., x_p]$ to $\mathbf{u} = [u_1, ..., u_p]^T$ is $\mathbf{z} = \mathbf{x}^t \mathbf{u} \mathbf{u}$

Variance of the projections:

$$\frac{1}{n} \sum_{i=1}^{n} (\mathbf{x}_{i}^{T} \mathbf{u})^{2} = \frac{1}{n} \sum_{i=1}^{n} (\mathbf{x}_{i}^{T} \mathbf{u})^{T} (\mathbf{x}_{i}^{T} \mathbf{u})$$
$$= \frac{1}{n} \sum_{i=1}^{n} \mathbf{u}^{T} \mathbf{x}_{i} \mathbf{x}_{i}^{T} \mathbf{u}$$
$$= \mathbf{u}^{T} (\frac{1}{n} \sum_{i=1}^{n} \mathbf{x}_{i} \mathbf{x}_{i}^{T}) \mathbf{u}$$

Omid Safarzadeh Ingeligian Schalafel Lange February 2, 2022 6/16

Optimization problem

• $\Sigma = \frac{1}{n} \sum_{i=1}^{n} \mathbf{x}_i \mathbf{x}_i^T$ is the sample covariance matrix of the data maximize $\mathbf{u}^T \Sigma \mathbf{u}$ subject to $||\mathbf{u}|| = 1$

Method of Lagrange multipliers:

$$\Rightarrow$$
 maximize $\mathbf{u}^T \Sigma \mathbf{u}$ subject to $\mathbf{u}^T \mathbf{u} = 1$ \Rightarrow maximize $\mathscr{L}(\mathbf{u}, \lambda) = \mathbf{u}^T \Sigma \mathbf{u} - \frac{\lambda}{\lambda} (\mathbf{u}^T \mathbf{u} - 1),$ $\Rightarrow \Sigma \mathbf{u} = \lambda \mathbf{u}$

Omid Safarzadeh Introduction to Statistic Heatings February 2, 2022 7/16

Result

- ullet Principal eigenvector of Σ is the principal component
- \bullet k eigenvectors with the k largest eigenvalues form all k principal components

PCA algorithm

- **1** Given $\mathbf{X} = [\mathbf{x}_1^T, ..., \mathbf{x}_n^T]^T$, compute $\Sigma = \frac{1}{n} \mathbf{X}^T \mathbf{X}$
- ② Compute all eigenvalues $\lambda_1 \geq \lambda_2 \geq ... \geq \lambda_p$ of Σ , and the corresponding eigenvectors $\mathbf{u}_1,...,\mathbf{u}_p$
- **3** Pick $k \leq p$ eigenvectors with the largest eigenvalues, i.e., $\mathbf{u}_1,...,\mathbf{u}_k$
- For all i = 1, ..., n, let $\mathbf{z}_i = \begin{bmatrix} z_{i1} \\ z_{i2} \\ \vdots \\ z_{ik} \end{bmatrix} = \begin{bmatrix} \mathbf{x}_i' \ \mathbf{u}_1 \\ \mathbf{x}_i^T \mathbf{u}_2 \\ \vdots \\ \mathbf{x}_i^T \mathbf{u}_k \end{bmatrix}$

Can we recover \mathbf{x}_i exactly from \mathbf{z}_i ?

$$\hat{\mathbf{x}}_i = z_{i1}\mathbf{u}_1 + z_{i2}\mathbf{u}_2 + \cdots + z_{ik}\mathbf{u}_k$$

Omid Safarzadeh Intorlication to Statistic Heading February 2, 2022 9/16

PCA example - Arrest dataset

- Number of arrests per 100; 000 residents for 50 states in the US (n = 50)
- $X_1 = Assault, X_2 = Murder, X_3 = Rape, X_4 = UrbanPop$ (percent living in urban areas), p=4
- ullet Centralize and standardize the data, and then, apply PCA (k=2)
- Principal component loading vectors:

$$\mathbf{u}_1 = \begin{bmatrix} 0.54 \\ 0.58 \\ 0.54 \\ 0.28 \end{bmatrix} \qquad \mathbf{u}_2 = \begin{bmatrix} -0.42 \\ -0.19 \\ 0.17 \\ 0.87 \end{bmatrix}$$

• For each $\mathbf{x}_i = [x_{i1}, x_{i2}, x_{i3}, x_{i4}]^T$ compute principal component scores $\mathbf{z}_i = [z_{i1}, z_{i2}]^T$, where

$$z_{i1} = \mathbf{x}_i^T \mathbf{u}_1 = 0.54x_{i1} + 0.58x_{i2} + 0.54x_{i3} + 0.28x_{i4}$$

$$z_{i2} = \mathbf{x}_i^T \mathbf{u}_2 = -0.42x_{i1} - 0.19x_{i2} + 0.17x_{i3} + 0.87x_{i4}$$

Omid Safarzadeh Introduction (Visionic Islandia February 2, 2022 10 / 16

Data visualization using PCA

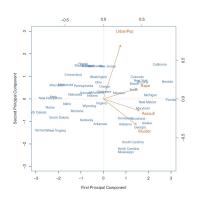

Figure: James et al., 2013

$$z_{i1} = \mathbf{x}_{i}^{T} \mathbf{u}_{1} = 0.54x_{i1} + 0.58x_{i2} + 0.54x_{i3} + 0.28x_{i4}$$
$$z_{i2} = \mathbf{x}_{i}^{T} \mathbf{u}_{2} = -0.42x_{i1} - 0.19x_{i2} + 0.17x_{i3} + 0.87x_{i4}$$

Omid Safarzadeh Brasiliana in Statistical Empire February 2, 2022 11/1

Interpretation of the results

- Crime-related variables are correlated with each other
- UrbonPop is less correlated with crime-related variables
- States with high value in first component = states with high crime rates
- States with high value in the second component = states with high level of urbanization

• Left: unit variance, Right: no scaling

Omid Safarzadeh Broothisamuro Sarassas Isananya February 2, 2022

How to choose k?

- Proportion of variance explained (PVE)
- Total variance:

$$\sum_{j=1}^{p} \frac{1}{n} \sum_{i=1}^{n} x_{ij}^{2}$$

Variance explained by the mth principal component

$$\frac{1}{n}\sum_{i=1}^{n}z_{im}^{2} = \frac{1}{n}\sum_{i=1}^{n}(\mathbf{x}_{i}^{T}\mathbf{u}_{m})^{2} = \frac{1}{n}\sum_{i=1}^{n}(\sum_{j=1}^{p}x_{ij}u_{mj})^{2}$$

- $PVE(m) = \frac{\sum_{i=1}^{n} (\sum_{j=1}^{p} x_{ij} u_{mj})^2}{\sum_{j=1}^{p} \sum_{i=1}^{n} x_{ij}^2}$
- $PVE(\text{first } k) = \sum_{m=1}^{k} PVE(m)$
